# Deep Learning

Solving handwritten formulas

**„Why not create a neural net that is able to solve handwritten equations?“**

**Jeremy on Winckelmann**

# Motivation

# Motivation

## Why even bother?

- Automatic grading of math assignments in school
- Change calculator interfaces to written formulas instead of typed formulas
- Improve possibilities for digital bookkeeping
- ...

# Specification

# Specification

**What exactly do we want to do?**

- Focus on equations consisting of numbers  $n \in \mathbb{Z}$
- That are chained by the operations  $\{+, -\}$
- Explore different approaches to solve the problem
- ...

**Training data**

# Training data

## What data do we use for training?

- We created the formula images ourselves
- We use MNIST
- And the math symbols dataset from Kaggle\*
- Variable padding left/right and top/bottom for each digit

$$865 + 72 + 3 + 3$$

$$458 + 7650 - 712$$

$$8068 + 26$$

$$15 + 79 + 3$$

$$60 - 18 - 3 - 6$$

$$3 + 1 - 71 + 866$$

$$83 - 21 + 128$$

$$963 + 40$$

# Methods

# Methods

## A very simple approach

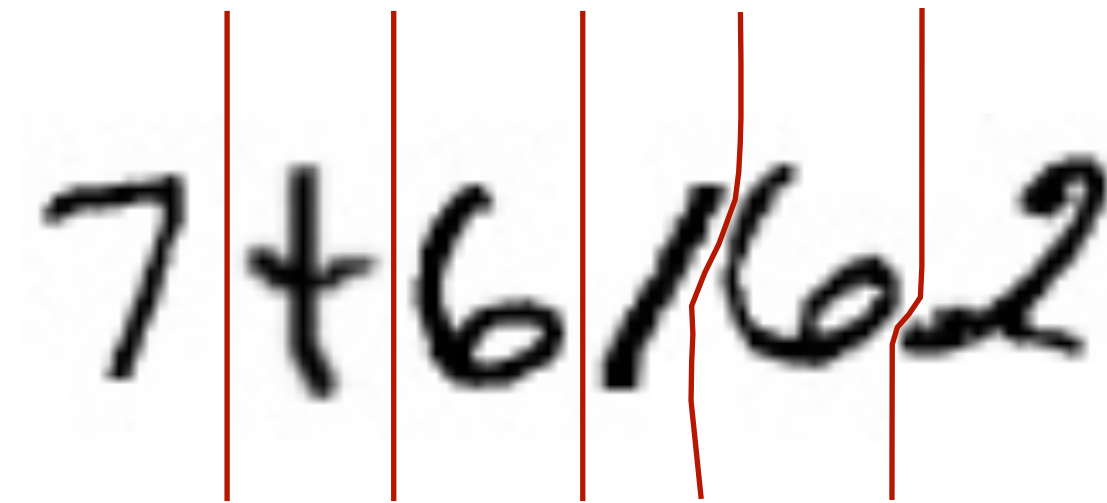

- Split characters at vertical white lines
- *Then loop over all recognized characters*
- *Pad the characters to 64 x 64*
- Input the character into a CNN that was trained on MNIST and {+, -}
- *Join all network outputs*
- *Compute with Python*

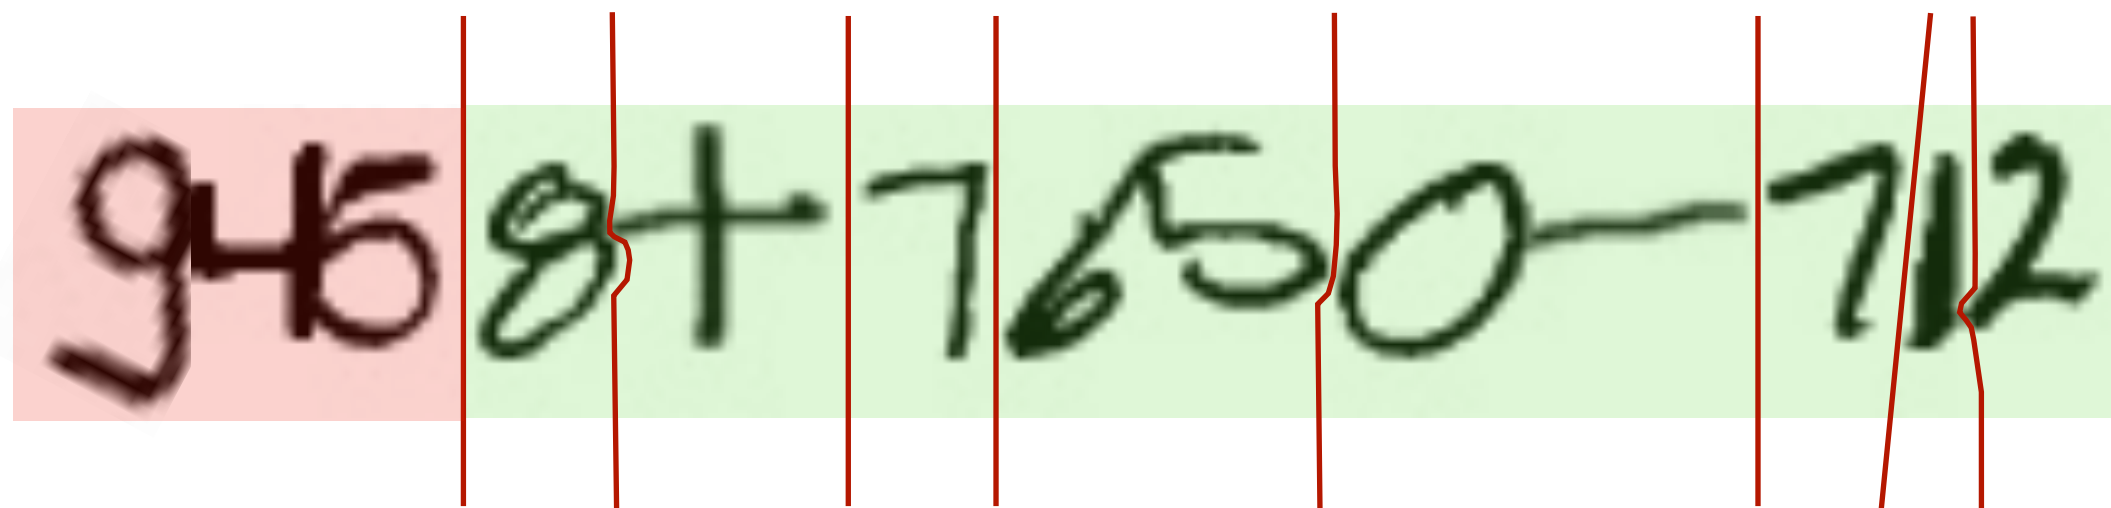

# Methods

## An improved, simple approach

- Split characters at wiggled white/grey lines
- *Then loop over all recognized characters*
- *Pad the characters to 64 x 64*
- Train the CNN on single characters and combinations of two characters
- Input the character(s) into a CNN that was trained on MNIST and {+, -}
- *Join all network outputs*
- *Compute with Python*

7+6/62

9458+7650-712

# Methods

## A sophisticated approach

- Look to Huggingface for help
- Finetune the trOCR\* model on the self-created formulas
- Deploy the model

**Live Demo**
